

Amendments to the specification:

Please amend the specification as follows:

Please replace paragraph [0064.02] at page 15 of the specification with the following paragraph [0064.02].

[0064.02] The client computer typically includes a bus connecting a number of components, such as a processing unit, a main memory, an I/O controller, a peripheral controller, a graphics adapter and a network interface adapter. The I/O controller is connected to components, such as a harddisk drive. The peripheral controller is connected to components, such as a keyboard. The graphics adapter is connected to a monitor; and the network interface adapter is connected to the network. The network includes the internet, an intranet, the world wide web and other forms of networks. Different components of the present invention can be in different elements. Nonetheless, there is no restriction preventing all components, including storage, to reside in one element such as the client computer.
